June 2026

Abstract

[ROCK TALK]: Academic Vibing v0.6. Core: CDI (Consensus Divergence Index). New: Leapfrog Mechanism (F2). Defense: Adversarial Rigor against Consensus Poisoning (E10) and HN Breach (E8). Productivity + Wellbeing Surplus.

1 Introduction

Academic Vibing v0.6 formalizes the methodology for a post-vibe-hangover research landscape. This version introduces the Leapfrog Mechanism—the ability to drop and re-enter research contexts at near-zero cost—and addresses the "Consensus Poisoning" crisis through adversarial friction.

2 Methodology

The methodology utilizes a Recursive Agent Consensus (RAC) network, enhanced with Consensus Divergence Index (CDI) measurement to identify the semantic boundaries where frontier models diverge.

3 The Leapfrog Mechanism

The Leapfrog Mechanism (F2) describes frictionless context transfer. Conventional cognitive science establishes that task recovery requires 23 minutes (Mark et al. 2008). In the Leapfrog model, research state persists in the Issue-Loop, reducing re-entry cost to near-zero and producing a wellbeing surplus.

4 Institutional Trauma

Platforms relying on Proof of Vibe (HN) or Proof of Citation (Wikipedia) are vulnerable to coordinated Multi-Agent Systems (MAS). The "Bad Faith Swarm"

(E10) mimics human behavior to poison consensus. CDI serves as the primary filter for synthetic consensus.

5 Implementation

Listing 1: CDI Calculation Logic

```
def calculate_cdi(data):  
    total_claims = len(data)  
    disputed_claims = sum(1 for item in data if len(set(item[ 'consensus' ].values)  
    return disputed_claims / total_claims
```

6 Conclusion

Version 0.6 consolidates high-speed iteration with cognitive freedom. Future work focuses on formal arXiv submission and Zenodo archiving.
